

POLYESTER PIPES

Due to the many years of development and production of polyester items, GRP pipes, in particular, company Poliester Cevi d.o.o. Priboj has specialised in the production of specific product groups and in particular GRP pipes. Following the latest developments in pipe and tank production, the company has fully won over the production of cylindrical products made of polyester, gaining a vast experience and knowledge in the process.

Polyester pipe is a product of the continuous filament winding machine and is commonly abbreviated as GRP, FRP, or fibreglass pipe. Such a pipe can exhibit a wide range of mechanical and chemical properties by combining glass fibres, thermosetting resin, and special fillers in the appropriate ratio during the production stage.

The composite structure may contain granular or platelet fillers, agents, pigments, or dye. By selecting an appropriate ratio of resin, glass fibres, fillers, as well as design, the manufacturer may create a product which meets the most stringent product specifications.

Fibreglass composite technology allows the GRP pipe to be favourably compared with pipes made of traditional materials in terms of price-performance ratio. Since fibreglass composites provide such outstanding properties, the number and type of products manufactured efficiently, effectively and with quality increases each year. Poliester Cevi d.o.o. Priboj has obtained numerous certificates and technical reports on the products' quality, as well as the Integrated Management System certificates in accordance with ISO 9001, ISO 14001 and ISO 45001.

PIPE WALL STRUCTURE

LAYER	CONSTRUCTION	FUNCTION
Internal liner	Surface veil	Protection
Barrier	Chop roving	Protection
Internal structural layer	Direct and chop roving	High coefficient of structural reinforcements
Core	Silica sand, chop and direct roving	Durable hard core
External structural layer	Direct and chop roving	High coefficient of structural reinforcements
Surface layer	Surface veil	Protection

Note: Resin is implied in each layer!

Figure 2 - Pipe wall structure

The good physical and chemical properties of polyester pipes have resulted in a wide range of applications, including:

- Sewage systems;
- Bridge drainage;
- Potable water transportation;
- Raw water transportation;
- Industry waste water transportation;
- Sea water transportation;
- Irrigation systems;
- Cooling water transportation;
- Ventilation systems;
- Drainage systems;
- Pipelines for hydropower plants;
- Pipelines for mine shafts and suspended/overhead pipelines.

Polyester pipes are produced using non-corrosive material which results in:

- Long lasting and efficient lifetime;
- Unnecessary cathodic protection;
- Unnecessary lining, coating and painting;
- Low maintenance costs;
- Stable hydraulic properties over an extended period of time

<p>Low pipe weights(1/4 of the cast iron pipe weight or 1/10 of the concrete pipe weight).</p>	<p>Easy to install. Expensive equipment for pipe assembly is unnecessary. Low transportation costs.</p>
<p>Exceptional smoothness of pipe walls.</p>	<p>The minimum weight of settled sludge contributes to low maintenance costs.</p>
<p>Pipes are produced in long sections.</p>	<p>Fewer connections reduce the assembly time.</p>
<p>Couplings are made of polyester with double sleeves and rubber gaskets.</p>	<p>Ease of assembly – short assembly time. Leak-tight and efficient couplings are designed to eliminate infiltration and leakage. Joint connectors are redundant. They enable flexible changes in the pipeline axes.</p>
<p>Specifications meet the standards worldwide.</p>	<p>Provides a high-quality specification of the product.</p>
<p>The optimal price-performance ratio in pipes, based on the full knowledge of the properties and characteristics of the material and the process.</p>	<p>The pipe system of fibreglass composites displays extraordinary strength properties in relation to its weight. In that sense, they are superior to steel pipes.</p>
<p>Production based on high technology.</p>	<p>Constant quality is guaranteed for all applications.</p>

MATERIAL SYSTEM

The material system consists of glass fibres, thermosetting resins and additives, designed and processed to satisfy the criteria of specific functional performances. Knowing the relationships between system components allows for defining the price, properties and performances of polyester pipes.

The material system used in polyester pipes production is comprised from:

- Roving (glass reinforcement);
- Resin;
- Catalyst system;
- Silica sand;
- Additives.

ROVING

Roving glass (roving) is an alkali-free glass fibre expressed in tex unit (g/1000m length). It is used in the form of direct and/or chop roving.

Hoop/Direct roving of various tex values provides pressure resistance and exceptional mechanical properties.

Chop roving provides strength in various directions.

RESIN

One of the basic components of polyester pipes is resin. At delivery, polyester resin already includes monomers. By further adding the monomer component, such as styrene, resin viscosity may be changed. The standard application temperature is 25°C.

CATALYST SYSTEM

The catalyst system consists of the accelerator and catalyst. The accelerator is added before the production process starts, while the catalyst is added during the pipe production process.

SAND

Sand (silica sand) is added to the pipe core and internal layer of the BETO coupling. The role of sand is to provide the pipe stiffness and enable easier grooving inside the BETO coupling.

ADDITIVES

Additives are mixed with resin and are used as accelerators. If the pipes are used for bridge drainage, i.e. are not installed underground, UV-stabilizer is also added into the resin.

MECHANICAL, PHYSICAL, AND CHEMICAL PROPERTIES

Polyester pipes are resistant to a wide range of chemicals and temperatures and may also be fabricated as specifically resistant to abrasion and weathering. The choice of resin depends on how aggressive the environment is or the media being transported. The system of materials shall provide excellent mechanical-physical and chemical properties which are required in the finished product.

Density	(1800-2100) kg/m ³
Elastic modulus	(6 -24) GPa
Elastic modulus circumferential - tensile and bending	17 000 MPa - low pressure pipes 24 000 MPa - high pressure pipes
Elastic modulus longitudinal - tensile and bending	(6000-12 500) MPa
Tensile strength circumferential	(130-700) MPa
Tensile strength axial	(30-60) MPa
Bending strength circumferential	140-500 MPa
Elongation at break	1,5-2,0 %
Linear expansion coefficient	24-30·10 ⁻⁶ 1/°C
Max. temperature of transported media	50 °C
Thermal conductivity coefficient	0,14-0,25 W/mK

HYDRAULIC PROPERTIES

In almost any conditions of application, polyester pipes display considerable advantages in terms of fluid flow (due to their smooth internal surface), corrosion resistance and resistance to deposit accumulation, when compared to other materials, whether metallic or non-metallic.

The most significant advantages are:

- The smooth internal surface of polyester pipes results in lower fluid resistance which contributes to a significant reduction of the maintenance costs during the life period of a pipe system.
- In most applications, the internal surface of the pipe remains smooth over time. Likewise, the fluid resistance does not increase.
- The internal diameter of polyester pipe (ID) is usually smaller than the ID of the corresponding steel pipe for the same conditions, which significantly reduces costs.

Absolute roughness	k = 0,012 mm
Hazen-Williams constant	C = 150
Manning constant	n = 0,0095-0,012

PIPE DIAMETERS

Polyester pipes may be supplied with a wide span of diameters, such as:

Nominal diameter DN (mm)				
100	400	900	1500	2100
150	450	1000	1600	2200
200	500	1100	1700	2300
250	600	1200	1800	2400
300	700	1300	1900	2500
350	800	1400	2000	3000

PRESSURE CLASS

Polyester pipes are supplied with pressure classes as follows.

SN (Pa)		SN 2500								SN 5000								SN 10000							
DN(mm)	PN(bar)	1	2,5	6	10	16	20	25	32	1	2,5	6	10	16	20	25	32	1	2,5	6	10	16	20	25	32

STIFFNESS CLASS

Pipe stiffness is the ability of the pipe to withstand traffic and soil (i.e. trench) loads, as well as the internal pressure. The pipe stiffness is the ratio of the product of ring flexural modulus of elasticity (pipe wall material) and the moment of inertia of the unit length of pipe to the third power of the pipe diameter ($STIS = EI/D^3$).

According to the AWWA C950 and ASTM standards, the material stiffness is expressed in psi units, while the EN ISO standards express the stiffness in N/m^2 (Pa). Polyester pipes may be supplied with four standard stiffness classes, although they may be supplied with a higher stiffness class as per the customer's request.

Standard stiffness classes	
Designation	Stiffness
SN	N/m^2 (Pa)
1250	1250
2500	2500
5000	5000
10000	10000

LENGTH

The standard length of polyester pipes is 6 and/or 12 meters. However, they may be supplied in other lengths depending on the customer's request.

HYDROSTATIC PRESSURE

Hydrostatic testing is the main indicator of pipe quality and is a prerequisite for all pressure pipes unless agreed otherwise. Test pressure is $1.5 \times \text{PN}$ (PN=nominal pressure).

PRODUCTS LINE

Different production processes enable the fabrication of the most diverse GRP products for various applications.

The main GRP products are:

- pipes
- couplings
- fittings
- storage tanks, filters, pumping stations
- the light liquid separating units
- inspection chambers (manholes).

Along with other products for various applications available at the customer's request, the line of products for the drainage of wastewater from bridges and motorways takes a special place. This line covers the entire system of pipes and fittings with diameters ranging from DN50 (fittings) to DN800, with stiffness classes SN5.000 and SN10.000.

GRP products for bridge drainage are fabricated with UV protection, as well as with the flammability class B2 in accordance with the DIN 4102 standard as per the customer's request. Moreover, to meet the aesthetic criteria of melting with the environment, these may be fabricated in any colour as per the customer's request.

For more information on the drainage line, as well as manholes, inspection chambers and the line of products for the small hydropower plants, our separate catalogue editions are available upon your request.

Polyester fittings are supplied with same pressure classes as the pipes and are fabricated by different procedures depending on their final application and customer's request, following the prescribed product standards.

Fitting production procedures include:

- laminating pipe segments together
- winding on a mould
- hand lay-up on a mould.

The assortment of fittings includes:

- Tees
- Branches
- Bends/Elbows (for any angle)
- Reducers (concentric and eccentric)
- Saddles
- Flanges / Stub ends (F and FF-pieces)

Along with these and depending on the products line, other fittings that make the drainage and transportation of waste water easier and more efficient are also available.

PIPE ASSEMBLY METHOD

Various methods are available for joining fibreglass pipes, both for gravity flow and for pressure pipelines. Joints shall provide sealing against fluids and withstand longitudinal forces.

GRP pipes may be joined by one of the following methods:

- GRP BETO couplings (Fig. 3);
- Straub or Teekay steel coupling (Figures 5 and 6)
- Butt-strap joint (Fig. 7)
- Flanges / Stub ends

Figure 3 - Beto coupling

POLYESTER BETO COUPLING

Beto coupling is a symmetric, double-sided sliding coupling made of reinforced polyester. It is supplied with rubber sealing rings and a rubber profile - stopper (fig. 4). The sealing rings which provide leak-tightness and the stopper which secures the proper position of both pipe and coupling are placed in precisely processed grooves inside the coupling.

The width of GRP BETO coupling:

- For DN300 up to DN500 - B=270 mm
- For DN >500 - B=330 mm

Three factors contribute to the efficient sealing of a Beto coupling, such as:

- Sealing lips
- Gasket compression
- Wedge-shaped grooves.

Figure 4 - Joint with a Beto coupling

STEEL COUPLING

When connecting GRP pipes to pipes made of different materials, this is one of the recommended methods. This type of assembly has proved to be very useful in the reparation of damaged pipes. Couplings of this type may be supplied as flexible or repair. They include a steel casing/body with internal sliding rubber gaskets. The body can be stainless steel or coated with specially designed material. The usage of metal coupling is both time and cost-efficient. The most notable manufacturers are TEEKAY and STRAUB (fig. 5 and fig. 6.).

Figure 5 - TEEKAY Repair coupling

Figure 6 - Straub fixed coupling

BUTT AND STRAP JOINT

The butt and strap joint (fig. 7) is normally used for joints which are to withstand larger axial forces and where inseparable pipe connection is necessary (subaqueous pipelines etc.). The length and thickness of the joint depend on usage conditions, pipe diameter, operating pressure, etc.

Figure 7 - Butt and strap joint

FLANGED JOINT

Flanges are bonded to pipe ends and are mechanically connected. Sealing is achieved by elastomeric sealing rings. This type of connection is separable but highly reliable and it enables the installation to be disassembled in some further stage, if necessary. It is convenient when connecting to pipes made of other materials, as well as valves and various other fixtures.

It is supplied as

- Pre-cast fixed flange on a short piece of GRP pipe (fig. 8);
- Pre-cast loose GRP flange and a stub end on a GRP pipe (fig. 9).

Figure 8 - Joint with fixed flanges

Figure 9 - Joint with loose flanges

SELECTION AND INSTALLATION

The selection of GRP pipes is based on compliance with the requirements for stiffness and pressure class.

The stiffness shall be chosen according to:

- Native soil compactness (blow count acc. to Proctor);
- Depth of cover layer above the pipe crown;
- Type of backfill material;
- Negative pressure, if any;
- Traffic loads

The tables below show approximate limits relative to backfill material, negative pressure in the pipe and traffic loads.

INSTALLATION	MAX. COVER LAYER DEPTH (m)			
	SN 1250	SN 2500	SN 5000	SN 10000
1	7	8	12	16
2	6	7	10	14
3	4	5	8	12
4	NR	3	6	10
5	NR	NR	NR	3

Native soil, dumped
 Bedding (pipe zone material) depth DN/4 or max. 150mm
 Gravel with max. relative density greater than 70% (ASTM D4253)
 Clean sands with less than 12% fines; 90% standard Proctor density (ASTM D698)
 Sand at 90% standard Proctor density or gravel greater than 70%, max. relative density up to 4
 Sand, dumped

DN - Nominal pipe diameter (mm)
 NR - Not recommended
 1* - max. 300 mm

NOTE: Other backfill materials may be allowed. Installation conditions 1-5 are outlined as typical. Detailed instructions may be found in Pipe Installation Manual Cpl01 issued by Poliester Cevi d.o.o. Priboj. For other installation types, consult our technical staff at all times.

INSTALLATION	ALLOWABLE NEGATIVE PRESSURE (KPa)			
	SN 1250	SN 2500	SN 5000	SN 10000
1	-50 -75 (up to 5 m) -100 (up to 3 m)	-100	-100	-100
2	-25 -50 (up to 4 m)	-75 -100 (up to 6 m)	-100	-100
3	NR	-25 -50 (up to 4 m)	-75 -100 (up to 6 m)	-100
4	-	-25	-50 -75 (up to 4 m)	-100
5	-	-	-	-100*

NOTE: Allowable negative pressures are given at maximum cover depths

1* - tamping by foot
NR - Not recommended

SELECTION AND INSTALLATION

TRAFFIC LOAD

In case of traffic loads all pipe zone backfill must be compacted. Minimum cover restrictions are given in the table below:

SPECIFIC LOAD	VEHICLE	MIN. COVER (m)
AASHTO H20	TRUCK	1,0
BS 153 HA	LORRY	1,5
COOPER E80 RR	RAILROAD	3,0

PRESSURE

The pressure class shall be the same or higher than the operating pressure. Pressure class is based on the pressure value which the pipe shall withstand during a 50-year life cycle and it is calculated by the following formula:

$$PN = \frac{HDB\ 50g.}{FS}$$

PN	pressure class
HDB 50 g.	pressure value to be sustained by the pipe when 50 years old
FS	safety factor <i>Taken as FS=1.8 during 50-year life cycle.</i>

PIPE INSTALLATION

A long lifetime and good properties in the usage of GRP pipes are only achieved through appropriate handling and installation. The pipe is designed to use bedding and the backfill zone as supports. Through experience, designers reached the conclusion that well-compacted granular soils are ideal for backfill. The pipe and backfill materials together form a high-performance pipe-soil system. For laying and installation of the pipes, our *Installation Manual Cpi01*, with details on handling and installation, is highly recommended.

The following data are a partial overview of the installation procedure.

TRENCH PREPARATION

In the pipe backfilling zone, the trench shall always be wide enough to enable placement and compaction of the pipe zone backfill materials (Fig.10). When rocks, harder material, and soft and loose or highly expansive soil are present at the bottom of the trench, the thickness of the bedding must be increased so as to provide adequate and uniform support for the pipe.

PIPE DIAMETER DN (mm)	MIN. WIDTH A (mm)
300	150
350-500	200
600-900	300
1000-1600	450
1800-2400	600

Dimension A has to allow for adequate space to operate with the compaction and pipe assembly equipment.

Figure 10 - Standard trench detail

BEDDING

Trench bedding of suitable material should provide uniform and continuous support for the pipes. Sand or gravel may be used as the bedding material. The bedding has to be compacted up to 90% standard density according to Proctor (70% max relative density for rubble and gravel). The finished bedding should be flat.

BACKFILL MATERIALS

To ensure a satisfactory pipe-soil system, adequate backfill material shall be used. Most coarse-grained soils (as classified by *The Unified Soils Classification System*) are considered acceptable bedding and pipe zone backfill material. Detailed instructions are provided during project negotiation.

PIPE ZONE BACKFILLING

The appropriate pipe zone backfill requirements are determined by native soil conditions and selected stiffness class. Quality material installation in the pipe zone is of vital importance for the proper functioning of a pipeline within the warranty period. Check if grained material is tucked fully under the pipe in order to accomplish full support (Figures 11 and 12.) A board or similar blunt tool may be used to push and compact the backfill material. Performing this procedure in detail is a crucial phase of pipe backfilling. When backfill has reached up to half of the pipe (half of the diameter), compress near the trench wall first, progressing towards the middle. All remaining details on backfilling are provided in our *Pipe Installation Manual Cpi01*.

Figure 11 - Full pipe support

Figure 12 - Incorrect lateral support of pipe

PIPELINE DEFLECTION

Material which is used to produce GRP pipes has a relatively low elastic modulus; hence, the control of vertical deflection of pipe is the best indicator of the pipe installation quality. Pipe deflection should not exceed 5% nominal diameter long-term. Bulges, flattening or other sudden changes in the wall curve are not allowed. The deflection check should be performed as soon as the first installed pipe is buried and it continues periodically throughout the whole project. Maximum diameter deflection during installation should not exceed the values given in the table below.

Allowable initial vertical deflection during installation

NATIVE SOIL	SOIL GROUP			
	1	2	3	4
Allowable initial deflection during installation (% of diameter)	3,0	3,0	2,5	2,0

Classification of the native soil groups

SOIL GROUP	Classification of the native soil			
	1	2	3	4
Cohesive (fine graded)	Hard and very stiff	Stiff	Medium	Soft
Granular (rough graded)	Very dense and dense (compressed)	Medium	Incoherent	Very incoherent
Blow count	>30	16-30	6-15	3-5

SELECTION AND INSTALLATION

ANGULAR DEFLECTION

Maximum angular deflection for each coupling joint shall not exceed the values given in the table below. Also, the pipes shall be connected in a straight line, and then deflect under an angle, if necessary.

Fig. 13 - Angular deflection in coupling joint

Nominal pipe diameter (mm)	Nominal installation deflection, (°)	Nominal slope (mm)			Nominal curvature radius (m)		
		Section length (m)			Section length (m)		
		3	6	12	3	6	12
300 up to 600	3,0	157	314	628	57	115	229
700 up to 800	2,5	131	262	523	69	137	275
900 up to 1000	2,0	105	209	419	86	172	344
1100 up to 1300	1,5	79	157	314	115	229	458
1400 up to 1600	1,25	65	131	262	138	275	550
1800 up to 2400	1,0	52	105	209	172	344	688

Nominal pipe diameter (mm)	PRESSURE (bar)			
	up to 16	20	25	32
	Maximum deflection angle (°)			
DN ≤ 500	3	2,5	2,0	1,5
500 < DN ≤ 800	2	1,5	1,3	1,0
900 < DN ≤ 1800	1	0,8	0,5	0,5
DN > 1800	0,5	-	-	-

Maximum deflection angle for coupling joint under pressure

Nominal angular deflection for coupling joint

NOTE It is certain that the joints with angular deflection in the systems under pressure have certain limitations.

SUPERVISION ON SITE

Poliester Cevi d.o.o. shall provide a supervisor on site during pipe installation at customer's request. The scope of services shall vary from permanent attendance to occasional visits depending on work schedule on site, complexity of the location and the installation results. The supervising body for the GRP pipes on site shall advise the Contractor in order to achieve the prescribed and designed results for the installed pipes.

STANDARDS

Polyester pipes comply with specifications and standards worldwide, such as:

- EN;
- ASTM;
- AWWA;
- ISO;
- DIN.

Here follows the overview of standards applied in production, testing, and quality verification of polyester pipes.

1. STANDARDS APPLIED IN RAW MATERIAL CONTROL AND TESTING

Standards for control and testing of resin quality

1. **ISO 2555** -viscosity testing
2. **ISO 2535** -gel time testing
3. **ISO 2811** -density testing
4. **ISO 3251**- Styrene content determination
5. **ISO 2114**- Acid number determination
6. **ISO 584** -Resin reactivity

Standards for control and testing of reinforcement fibre

1. **ISO 1889**- Linear density determination (tex)
2. **ISO 3344**-Moister content determination
3. **ISO 1887**- Loss on ignition
4. **ISO 3268**-(OC R110)Tensile strengt and reduction factor
5. **ISO 2078**-Glass type
6. **SNO5320** - Resin soaking time.

Standards for control and testing of silica sand

1. **OC R 115**- Carbonate content
2. **OC R 114**-Moister content
3. **OC R 112**-Loss on ignition
4. **OC R 116**-Resin wet out time
5. **ASTM E11**-Granulation.

Standards for control and testing of styrene

1. **ASTM D2121**-Polymer content in styrene monomer

Standards for control and testing of methyl-ethyl-ketoneperoxide (MEKP) Co octoate.

1. **ISO 2555**- Viscosity testing
2. **ISO 2535**- Ignition time testing
3. **OC R111**- water content in MEKP

2. STANDARDS APPLIED IN PIPE CONTROL AND TESTING

1. **ASTM D3567** Standard procedure for determination of pipe and fitting dimension
2. **AWWA C950** Standard for high pressure pipes for water supply
3. **ASTM D3517** Standard specification for fibreglass pipes for high pressure
4. **ASTM D3754** Standard specification for fibreglass pipes for sewage and industrial waste water
5. **ASTM D3262** Standard specification for sewage pipes
6. **ASTM D2412** Pipe stiffness and deflection
7. **ASTM D2583** Hardness acc. Barcol
8. **ASTM D 790** Bending properties of plastic materials
9. **ASTM D2290** Circumferential tensile strength
10. **ASTM D 638** Elongation properties of plastic materials
11. **ASTM C 581** Standard procedure for determination of chemical resistance of resin used in structures with reinforcement of glass fibre purposed for transport of liquid
12. **ASTM D4161** Standard specification for joints of fibreglass with usage of flexible gaskets of elastomer
13. **EN ISO 1172** Laminate structure (pipe)
14. **ASTM D3839** Standard procedure for underground installation

APPROXIMATE WEIGHT OF PIPES AND COUPLINGS

Slovensko tehnično soglasje STS-14/0023
Slovenian Technical Approval

Podejeto na podlagi določil Zakona o gradbenih proizvodih – ZGPro-1 (Uk. list RS, št. 82/2013) razrednjema gradbenima proizvoda.
On the basis of provisions of the Construction Products Act – ZGPro-1 (OG RS, no. 82/2013) granted to the following construction products:

Komercialno ime proizvoda: <i>Trade name</i>	Poliestrski revizijski jaški <i>Manholes and inspection chambers</i>
Imetnik soglasja / Proizvajalec: <i>Holder of approval / Manufacturer</i>	Poliester Cevi d.o.o. Priboj Ul. 4. Sandžačke bb 31330 PRIBOJ, Srbija
Vrsta in predvideni namen uporabe proizvoda: <i>Generic type and use of the product</i>	Jaški iz armiranega poliestra za drenažo in kanalizacijo pri globini podtalnice do 8 m <i>Manholes and inspection chambers, made of glass-reinforced thermosetting plastics (GRP), for drainage and sewerage, for ground-water depths of up to 8 m</i>
Veljavnost: <i>Validity</i>	od (from) 13.06.2019 do (to) 12.06.2024
Proizvodni obrat: <i>Manufacturing plant</i>	Poliester Cevi d.o.o. Priboj Ul. 4. Sandžačke bb 31330 Priboj, Srbija
Izdaja št.: <i>Issue No.</i>	2
To soglasje zamenjuje: <i>This Approval replaces</i>	STS-14/0023 veljavno od 13.06.2014 do 12.06.2019 STS-14/0023 veljavno od 13.06.2014 do 12.06.2019
To Slovensko tehnično soglasje obsega: <i>This Slovenian Technical Approval contains</i>	19 strani z vključno 5 prilogami <i>19 pages including 5 annexes</i>
